

Future ready!

A renewable fuel for your boiler

Works just like heating oil, but much better for the environment

**Future
Ready
Fuel**

- ✓ Cleaner and greener – reduces your carbon emissions by almost 90% compared to existing heating oil
- ✓ Simple conversion process that can be conveniently done when your boiler is serviced or upgraded
- ✓ Usual cost of conversion around £500 (exact cost depends on system)
- ✓ Made from fossil free, certified sustainable waste materials
- ✓ You won't notice the difference – runs just as efficiently as heating oil in your existing system and it's odourless too

Simple pathway to greener heating

For over 50 years heating oil has been a popular choice for homes off the gas grid.

To tackle climate change and achieve the UK's net zero target, we need to switch from fossil fuels to renewable heating.

The good news is you don't need to buy an expensive new heating system to do that – dramatic reductions in your household

emissions can be achieved simply by changing the type of fuel you use.

The liquid fuel heating industry is currently trialling a new product called HVO to replace heating oil.

The renewable liquid fuel works well in all existing oil heating systems following a simple, cost-effective conversion process.

Interested? Find out more...

We hope to start to introduce the new fuel in 2022, subject to the completion of successful trials and obtaining government approval to use HVO as a heating fuel.
